

AI Quant Engine for Web3 Markets

An AI quantitative decision-making and risk-control system for crypto markets

English Version · Mobile Reading Optimized

Connecting market data, on-chain capital flows, derivatives indicators and AI models to build a complete trading decision process from signal scoring and risk-gate screening to app notifications, one-click copy trading and shadow validation.

Version: V1.0

01 · PROJECT OVERVIEW

Project Overview

Crypto-K Quants, referred to as CKQ PRO, is an AI quantitative decision-making engine built for Web3 and crypto markets.

The system connects market data, on-chain capital flows, derivatives indicators and AI models, forming an end-to-end trading decision process from data input, feature engineering, AI signal scoring, risk-gate screening, AI + human review, app-based trading information notifications, full automatic one-click copy trading and shadow validation.

The objective of CKQ PRO is not to predict the future for users, nor to promise fixed returns. Its purpose is to help users reduce emotional trading, strengthen risk-control processes, and improve the consistency, transparency and traceability of trading decisions.

Core Value

- Use multi-source data to support market judgment;
- Use AI models to evaluate signal quality;
- Use Risk Gate mechanisms to filter high-risk signals;
- Use the app to deliver trading information to users;
- Support automated execution through one-click copy trading;
- Record signals, risk-control results and execution outcomes through shadow validation;
- Continuously verify strategy performance through review mechanisms.

**From data to execution, every step should be verifiable;
from signal to risk control, every decision should be
traceable.**

02 · MARKET PAIN POINTS

Market Background and User Pain Points

Crypto markets operate 24/7 and are characterized by high volatility, high leverage, high noise and strong emotional swings. Price movement is affected not only by candlesticks and volume, but also by on-chain capital flows, exchange net inflows/outflows, derivatives open interest, funding rates, liquidation pressure, whale activity and market sentiment.

Common problems faced by traders

- It is difficult to monitor the market continuously, so key changes may be missed;
- Single indicators can be misled by false breakouts, bull or bear traps and short-term noise;
- On-chain data, derivatives data, funding rates and liquidation pressure are scattered across platforms and hard to integrate manually;
- Emotional chasing and panic selling often cause inconsistency between plans and execution;
- In high-leverage environments, a single incorrect position may lead to significant loss;
- Without systematic review, it is hard to determine whether losses come from strategy, execution or risk control.

Therefore, users need more than trading signals. They need a systematic tool that can transform complex market data into clear trading states.

CKQ PRO is built around this need: data as the foundation, models as the judgment layer, risk control as the entry condition, app notifications and one-click copy trading as execution interfaces, and shadow validation as the review process.

System Positioning

AI Quant Engine for Web3 Markets

CKQ PRO is an AI quantitative decision-making and risk-control system for crypto markets. It is not a simple signal-calling tool, nor an automated trading robot that promises returns. It is a trading-support system built around market data, AI scoring, risk-gate screening, app-based notifications, one-click copy trading and performance review.

Market Data Integration

Integrates market data, on-chain flows, derivatives indicators and exchange-related data.

AI Signal Scoring

Uses multi-factor models to assess signal strength, trend quality and risk status.

Risk Gate

Checks risk conditions before trading information is sent or automatic execution occurs.

AI + Human Review

Combines model recognition and human review for key trading signals.

App Notifications

In semi-automatic mode, the app sends trading information and users manually place orders.

One-Click Copy Trading

After users subscribe and actively enable it, they enter full automatic mode.

Boundary note: Semi-automatic trading is not automatic order placement; one-click copy trading is not risk-free custody; API Keys do not need withdrawal permissions.

AI Decision Pipeline: Data, Scoring and Risk Gate

01 Market Data Input

The system connects price data, volume, candlestick structures, exchange data, on-chain capital flows, derivatives indicators, open-interest changes, funding-rate changes, liquidation-pressure changes and market volatility status. Multi-source data helps users understand the capital behavior and risk status behind price movement.

02 Feature Engineering

The system transforms raw data into computable, comparable and traceable market features, such as trend strength, volatility, volume abnormality, breakout quality, multi-timeframe confluence, capital-flow direction, open-interest changes, funding-rate bias, liquidation pressure and liquidity status.

03 AI Signal Scoring

The system does not rely on a single indicator or price pattern. It uses multi-source data, multi-timeframe structures and multi-factor models to score current market status and potential opportunities.

04 Risk Gate

Even if a trading opportunity receives a high AI score, it does not necessarily mean it is suitable for execution. Risk Gate checks volatility, liquidity, stop-loss space, position risk, leverage risk, risk-reward ratio, extreme liquidation pressure and signal conflicts.

Core principle: First determine whether a trade should be taken, then determine how it should be taken.

05 · REVIEW, EXECUTION, VALIDATION

AI + Human Review, Execution and Shadow Validation

05 AI + Human Review

AI quickly processes multi-source data, calculates scores, identifies signal status and evaluates risk conditions. Human review is mainly used for key trades, abnormal market conditions, extreme volatility, major events and model-uncertain states.

06 Auto & Semi-Auto Execution

Semi-automatic trading mode: The system sends trade direction, reference entry area, reference take-profit area, reference stop-loss area, strategy name, AI signal score, Risk Gate status and market-risk prompt through the app. After receiving the notification, users must log in to the exchange and manually place orders.

Full automatic one-click copy trading mode: After subscribing to a strategy in the app, users actively enable “One-Click Copy Trading.” Once enabled, the system may execute automatically based on the selected strategy, account API configuration and risk-control parameters.

07 Shadow Validation

The system records signal generation time, signal score, whether risk control passed, risk-blocking reasons, execution mode, entry status, take-profit and stop-loss status, subsequent market performance, strategy performance and review results.

Shadow validation helps determine whether a signal later proves effective, whether risk control is reasonable and whether execution deviates.

Core Technical Architecture

Market Flow

Combines candlesticks, volume, open interest, funding rates, liquidation data, order-book data and on-chain data to observe capital behavior behind price movement.

MTF Engine

Analyzes 5M, 15M, 1H, 4H and 1D timeframes to reduce single-timeframe misjudgment.

AI-Signal

Uses machine learning, multi-factor models and market-structure analysis to score potential opportunities.

Risk Gate

Filters risk before trading, and may block signals, downgrade signals or prompt caution.

Execution Loop

Semi-automatic mode sends information for manual orders; one-click copy trading executes after users actively enable it.

Multi-Exchange Support

Supports integration with major exchanges, subject to the actual website, app and backend display.

Key questions the system monitors

- Whether price increases are supported by expanding volume;
- Whether open interest and funding rates change together;
- Whether liquidation pressure or abnormal on-chain movements are present;
- Whether the current opportunity has reasonable stop-loss space and risk-reward ratio.

The purpose of the architecture is not to create a “certain answer,” but to turn complex information into clearer decision evidence.

On-chain Flow Radar

CKQ PRO does not only observe price movement. It also focuses on capital flows behind price movement, exchange fund changes, stablecoin flows, liquidation pressure, open-interest changes and funding-rate bias.

Whale Flow

Monitors large wallets, large transfers and abnormal capital activity as references for market-state analysis.

Exchange Netflow

Observes assets flowing into or out of exchanges to help assess potential selling pressure or holding behavior.

Stablecoin Flow

Tracks stablecoin flow changes to assess potential buying power and risk appetite.

Liquidation Pressure

Tracks liquidation clusters to identify wick, stop-run and extreme-volatility risks.

Open Interest

Observes derivatives open-interest changes to judge leveraged capital participation.

Funding Rate

Uses funding rates to observe long/short crowding and sentiment-overcrowding risk.

On-chain Flow Radar does not produce standalone buy or sell conclusions. Its role is to support AI scoring, Risk Gate and user judgment with additional evidence.

08 · COMMAND CENTER & RISK CONTROL

Quant Command Center and Risk-Control System

The Quant Command Center is CKQ PRO's user-facing decision display center. Its purpose is not to show a pile of complex data, but to compress market status, model signals, risk-control results and execution modes into decision states that users can understand.

Common command center states

- BTC Market State / ETH Signal Strength: market state and signal strength;
- Risk Gate Passed / Blocked: risk control passed or blocked;
- Volatility / Liquidity: volatility and liquidity status;
- Execution Mode: manual, semi-automatic or full automatic status;
- Signal Score / Shadow Validation: signal score and validation status.

Three-stage risk-control system

Pre-trade: Checks market status, volatility, liquidity, stop-loss space, risk-reward ratio, leverage risk, position risk, liquidation pressure, funding rates and signal conflicts.

In-trade: Monitors take-profit and stop-loss status, rapid market movement, exposure changes, signal invalidation, protection mechanisms and exchange or network abnormalities.

Post-trade: Evaluates signal validity, scoring quality, risk-control blocking, execution discipline, take-profit and stop-loss settings and whether the strategy needs adjustment.

Risk control is not a remedy after losses occur. It is a prerequisite before trading.

Execution Modes and API Key Permissions

Signal Alert Mode

Users receive market information, strategy signals, AI scores and risk-control prompts. The system only provides information alerts and decision support. Users decide whether to trade, when to trade, position size and take-profit/stop-loss settings.

Semi-Automatic Trading Mode

The app sends trading information to users. After receiving the notification, users must log in to the exchange and manually place orders based on their own judgment, capital size and risk tolerance.

- The system sends trading information;
- The user makes the final decision;
- The user manually places orders on the exchange;
- The system does not directly place orders for the user and does not control the user's account.

Full Automatic One-Click Copy Trading

After subscribing to a strategy in the app, users actively enable "One-Click Copy Trading." Once enabled, the system may automatically execute corresponding copy-trading operations based on the subscribed strategy, account configuration and risk-control parameters.

API Key permission: CKQ PRO does not require users to enable API withdrawal permissions. Users should disable withdrawal permissions, enable only necessary trading-related permissions according to system requirements, and properly safeguard API Keys.

Plans, App Flow and Suitable Users

Subscription Plan Overview

CKQ PRO provides Basic, Advanced and Pro Quant plans to meet different user needs. Specific prices, function scope and benefits are subject to real-time display on the website, app or backend.

- **Basic Plan:** For users who want to experience system stability and basic strategy information at a lower cost.
- **Advanced Plan:** For users with some trading experience who want long-term system-assisted trading.
- **Pro Quant Plan:** For larger-capital users, trading studios, trading teams and institutional partners.

Suggested App Flow

Visit the official website -> download the official app -> register or log in -> review strategy plans -> choose strategies -> receive app-based trading information alerts -> configure API Key if full automatic mode is needed -> actively enable one-click copy trading -> set position size, leverage and risk-control parameters -> regularly check records and review reports.

Suitable and Unsuitable Users

Suitable Users

Users with some trading experience who want to reduce emotional trading, follow position and risk-control discipline, and understand one-click copy trading risks.

Unsuitable Users

Users expecting guaranteed profit, not understanding leverage risk, unable to accept drawdowns, or expecting the system to bear all decision responsibility.

Users should download the app only from the CKQ PRO official website and avoid unknown third-party sources. Before using any mode, users should make independent decisions based on their own experience, capital size and risk tolerance.

RISK DISCLOSURE

Risk Disclosure and Disclaimer

All content provided by CKQ PRO, including strategy signals, model scores, market analysis, backtest results, app-based trading information notifications, one-click copy trading and execution-support functions, is for research and reference only. It does not constitute investment advice, financial advice, profit guarantees or asset management services.

- Crypto markets are highly volatile, and prices may change sharply within a short time;
- Derivatives and leveraged trading may amplify both gains and losses;
- Any strategy may experience consecutive losses, and historical backtest data does not represent future performance;
- Model scores and system signals are not 100% accurate;
- In semi-automatic trading mode, the app only provides trading information. Users must manually place orders on the exchange and bear the trading results themselves;
- In full automatic one-click copy trading mode, after subscribing to a strategy and enabling one-click copy trading in the app, the system may execute according to authorization and strategy rules. Users bear the relevant trading risks themselves;
- API Keys do not need withdrawal permission. Users should disable withdrawal permissions and properly safeguard API Keys;
- API execution results may be affected by network latency, exchange systems, slippage, liquidity and user configuration;
- Users should independently manage account funds, API permissions, position settings, leverage ratio and risk-control parameters;
- Users should not use funds they cannot afford to lose for high-risk trading.

CKQ PRO does not directly control user assets, does not require users to enable withdrawal permissions, does not promise returns, and does not bear responsibility for profits or losses arising from users' own trading decisions, manual orders or automated copy trading execution. Before using semi-automatic trading or full automatic one-click copy trading, users should make independent decisions based on their own experience, capital size and risk tolerance.
